system that combines frontier based exploration with continuous localization. A similar technique was also used in [7], the Autonomous Intelligent Knowledge-building Exploration (AIKE) system. To start, the AIKE generates grid-based maps and continuously refine the map building until the exploration is completed.

maps, the robots actively seek to verify their relative locations. Using shared maps, they coordinate their exploration strategies so as to maximize the efficiency of exploration. Our system was evaluated under extremely realistic real-world conditions. An outside evaluation team found the system to be highly efficient and robust.

information gain given the current maps, thereby driving the exploration of the environment. Our algorithm could also be used, for example, to monitor forest fires while avoiding fire damage, taking ocean measurements while avoiding damage from adverse weather, or mapping a chemical spill site while avoiding failure from caustic chemicals.
