Solid Mechanics Fatigue crack propagation Anders Ekberg 2 (20) Stress intensity factors and fracture In static loading, the stress intensity factor for a small crack in a large specimen can be expressed as $K_I = \sigma \sqrt{\pi a} = f(\sigma, a)$, where f depends on geometry. If the stress is kept constant, we will get fracture for a certain crack length, $a = a_C$, which will give $K_I = K_{IC}$.

Former Professor Department of Mechanical Engineering

The application of methods of fracture mechanics to the prediction of fatigue life presupposes the existence of a single flaw of a "critical" size the slow propagation of which, under repeated cyclic loading, represents the relevant damage mechanism that governs "fatigue" until the flaw has grown to unstable size.
