The versine or versed sine is a trigonometric function already appearing in some of the earliest trigonometric tables. The versine of an angle equals 1 minus its cosine. There are several related functions, most notably the coversine and haversine. The latter, half a versine, is of particular importance in the haversine formula of navigation.

The "Unit Circle" is a circle with a radius of 1. Being so simple, it is a great way to learn and talk about lengths and angles. The center is put on a graph where the x axis and y axis cross, so we get this neat arrangement here. Have a try! Move the mouse around to see how different angles (in ...

The secant, cosecant and cotangent are respectively the inverse of cosine, sine, and tangent. It is important to know what these functions look like graphically and how they compare. These ratios are common in a number of important 'Pythagorean identities'.

Right triangles are triangles in which one of the interior angles is 90°. A 90° angle is called a right angle. Right triangles have special properties which make it easier to conceptualize and calculate their parameters in many cases. The side opposite of the right angle is called the hypotenuse ...

Section 3-3 : Differentiation Formulas. In the first section of this chapter we saw the definition of the derivative and we computed a couple of derivatives using the definition. As we saw in those examples there was a fair amount of work involved in computing the limits and the functions that we worked with were not terribly complicated.
